Introduction

Intravenous sugar solution, also known as dextrose solution, is a mixture of dextrose (glucose) and water. It is used to treat low blood sugar or water loss without electrolyte loss. Water loss without electrolyte loss may occur in fever, hyperthyroidism, high blood calcium, or diabetes insipidus. It is also used in the treatment of high blood potassium, diabetic ketoacidosis, and as part of parenteral nutrition.

An intravenous sugar solution is a solution with a sugar (usually glucose, as known as dextrose, with water as the solvent) used for intravenous therapy, where it may function both as a means of maintaining tissue hydration and a means of parenteral nutrition.

The global I.V. solutions market was valued at USD 6.9 billion in 2015 and is expected to reach a value of USD 13.79 billion by 2024. Growing incidence rate of chronic diseases, such as cancer, is also fueling the demand for Total Parenteral Nutrition (TPN), which forms a vital part of the treatment. Intravenous nutrition helps sustain strength, maintains hydration levels in patients, and facilitates faster recovery. Cancer prevalence is forecasted to grow by 70% over the next few decades. This poses a colossal growth prospect for the market.
